The Fictional Town Garden Project

Alex Rivera

Homeroom 8A · September 2026

Introduction

Many schools plant small gardens to teach science and community care. This short paper explains a made-up project at Maple Bend Middle School. All details are synthetic.

Methods

Students measured plant height once a week for six weeks. They watered on Mondays and Thursdays and recorded weather in a shared notebook.

Results

Bean plants grew faster than lettuce in the sunny corner plot. The shaded plot grew more slowly but needed less water.

Discussion

A garden can connect math (measurement), science (life cycles), and writing (field notes). Teachers should plan for weekends when plants still need care.

Conclusion

Even a small plot can support cross-subject learning when roles are clear.
